

Amendments to the Claims

This listing of claims will replace all prior versions, and listings of claims in the application.

1. (Currently Amended) A voltage regulator circuit comprising:
a high voltage regulator capable of receiving an external high voltage supply and capable of outputting an intermediate supply voltage; and
a plurality of parallel low voltage regulators capable of receiving the intermediate supply voltage and capable of outputting a regulated output voltage, each of the parallel low voltage regulators having corresponding inputs cascode connected to an output of said high voltage regulator to receive the intermediate supply voltage;
wherein the intermediate supply voltage is no higher than a breakdown voltage of the low voltage regulators.
2. (Original) The voltage regulator circuit of claim 1, wherein the high voltage regulator is a low dropout voltage regulator.
3. (Original) The voltage regulator circuit of claim 1, wherein the low voltage regulators are low dropout voltage regulators.
4. (Original) The voltage regulator circuit of claim 3, wherein the low voltage regulators have a dropout voltage of not more than approximately 14 millivolts.
5. (Currently Amended) A voltage regulator circuit comprising:
a single high voltage regulator; and
a plurality of parallel low voltage regulators capable of receiving an intermediate voltage from the high-voltage regulator, and capable of outputting a regulated output voltage, each of the parallel low voltage regulators having corresponding inputs cascode connected to an output of said single high voltage regulator;
wherein the intermediate voltage is no higher than a breakdown voltage of the low voltage regulators.

6. (Original) The voltage regulator circuit of claim 5, wherein the high voltage regulator is a low dropout voltage regulator.

7. (Original) The voltage regulator circuit of claim 5, wherein the low voltage regulators are low dropout voltage regulators.

8. (Original) The voltage regulator circuit of claim 7, wherein the low voltage regulators have a dropout voltage of not more than approximately 14 millivolts.

9. (Original) The voltage regulator circuit of claim 5, wherein each low voltage regulator comprises:

a first stage capable of receiving a reference voltage and capable of having a first current flowing through the first stage;

a second stage, coupled to the first stage, capable of having a second current flowing through the second stage; and

a third stage, coupled to the second stage, capable of outputting an output voltage and capable of having a third current flowing through the third stage,

wherein the first, second and third currents are proportional to each other throughout a range of operation of the voltage regulator between substantially zero output current and maximum output current.

10. (Original) The voltage regulator circuit of claim 9, wherein the third stage includes a pass transistor, and the second stage includes a first mirror transistor and an input transistor in series with the first mirror transistor, and

wherein a gate of the first mirror transistor is driven by the same voltage as a gate of the pass transistor.

11. (Original) The voltage regulator circuit of claim 10, wherein the first stage includes a second mirror transistor, wherein a gate of the second mirror transistor is driven the same voltage as the gate of the pass transistor.

12. (Original) The voltage regulator circuit of claim 11, further including a low pass filter between the gate of the second mirror transistor and the gate of the first mirror transistor.

13. (Original) The voltage regulator circuit of claim 12, wherein the low pass filter is an RC network.

14. (Original) The voltage regulator circuit of claim 12, wherein the first stage includes a first trickle current source in parallel with a current source that is parallel with the first mirror transistor.

15. (Original) The voltage regulator circuit of claim 14, further including a second trickle current source supplying a trickle current to the second stage.

16. (Original) The regulator of claim 15, further including a first shut off transistor in series with the first mirror transistor and the input transistor of the second stage, a gate of the shut off transistor being driven by an opamp,
wherein the opamp inputs the reference voltage at a first input, and voltage from a resistor divider at a second input.

17. (Original) The voltage regulator circuit of claim 16, further including a second shut off transistor in series with the second mirror transistor and the input transistor of the first stage, a gate of the second shut off transistor being driven by an opamp.

18. (Original) The voltage regulator circuit of claim 16, further including an NMOS transistor between the first shut off transistor and the input transistor.

19. (Original) The voltage regulator circuit of claim 9, wherein a phase margin of the low voltage regulator is at least 60 degrees.

20. (Original) The voltage regulator circuit of claim 9, further including a feedback stage with a resistor divider between the third stage and the first stage, wherein a feedback voltage from the resistor divider controls an amplification of the first stage.
